We have compiled a comprehensive list of vehicles that can be fitted with SAVA tyres.

The List only gives the information as to the tread patterns, in which SAVA manufactures tyres of certain sizes, but the choice of the tread pattern itself is up to you. However, if sizes are available in different speed categories, we strongly recommend observing the vehicle manufacturers' instruction. Choosing a higher speed category tyre is by all means a good decision.

The Application List has been put together very carefully with you, our customer in mind, however, a misprint could be possible. Should you find any, we would appreciate your note, to up-date our next edition.

Should you have any questions or remarks about the Application List please mail to info@sava.si with the notice Application List - Scooter and Motorcycle Tyres, and we will endeavour to reply in the shortest time possible.

GB Tyre Inflation Pressure

It is of utmost importance for a safe ride to maintain a proper tyre inflation pressure. It is recommended to check it regularly, e.g. once a week, when tyres are cold. If the pressure is too high, the contact surface between tyre and road gets smaller and riding less comfortable. If the pressure is too low, the agility and stability of the vehicle is diminished, the tyre excessively warmed up and worn out, the fuel consumption increased and the top speed of the vehicle decreased.

When inflating tyres, the vehicle manufacturer's instructions should be observed (usually the minimum pressure is given). When two persons are riding or/and luggage is loaded, it is recommended to increase the pressure by 0.2 bar.

In general: It is better for the pressure to be higher than too low.

D Der Reifendruck

Der richtige Reifendruck ist ein wichtiges Kriterium für Ihre Sicherheit. Regelmäßig muss der Druck überprüft werden. Bitte stets dabei beachten, dass dies vor Fahrtantritt im kalten Zustand geschieht. Es ist ratsam, diesen Reifencheck grundsätzlich einmal in der Woche vorzunehmen. Ein zu hoher Reifendruck vermindert die Kontaktfläche zwischen Reifen und Straße. Dies geht zu Lasten Ihrer Sicherheit und vermindert den Fahrkomfort erheblich.

Ein zu niedriger Druck dagegen vermindert die Wendigkeit und Stabilität des Fahrzeugs. Zudem hat dies eine übermäßige Erwärmung und Abrieb des Reifens zur Folge. Der Kraftstoffverbrauch steigt. Die maximale Endgeschwindigkeit kann bei zu niedrigem Reifendruck nicht mehr erreicht werden.

Beim Reifenbefüllen müssen die Angaben des Fahrzeugherstellers (siehe Bedienungsanleitung des Fahrzeugs) berücksichtigt werden. Um 0,2 Bar sollte jedoch der Druck höher liegen, wenn mit Sozium und/oder Gepäck gefahren wird.

Grundsätzlich gilt: Im Zweifel den Reifendruck lieber etwas höher als zu niedrig halten.

E Presión de inflado en neumáticos

Para una conducción segura es de gran importancia mantener una correcta presión de inflado.

Es recomendable verificarlo regularmente, p.e. semanalmente, cuando los neumáticos estén fríos. Los conductores de motocicletas y ciclomotores rara vez se preocupan de comprobar la presión de los neumáticos. Si la presión es demasiado alta, el contacto con el suelo disminuye y la conducción se hace menos segura y confortable. Si la presión es demasiado baja, la estabilidad y manejabilidad del vehículo disminuye, el neumático se calienta y se desgasta en exceso, se incrementa el consumo de combustible y disminuye la potencia.

Para un correcto inflado se deberán observar las instrucciones del fabricante (normalmente se facilita la presión mínima). Es recomendable incrementar la presión de inflado en 0,2 bar cuando se circula con acompañante y/o con carga.

En general: Es mejor que la presión sea mas alta que mas baja.

CRO/SCG Tlak/pritisak punjenja

Tlak punjenja gume od velikog je značaja. Stoga se preporučuje redovno provjeravanje (npr. jednom nedjeljno) dok su gume hladne. Vozači motora odnosno skutera obično se rado bave sojnim vozilima, međutim rijetko se sjetе da provjere tlak.

Ispravan tlak veoma je važan za pravilnu vožnju. Previsok tlak smanjuje kontaktnu površinu gume sa podlogom i udobnost vožnje. Prenizak tlak pak smanjuje pokretljivost i stabilnost vozila, gume se pri tom pregrijavaju i suviše troše; povećava se takođe potrošnja goriva, a smanjuje konačna brzina vozila.

Za pravilan tlak punjenja neophodno je potrebno pridržavati se uputstava proizvođača vozila (obično navode minimalni tlak). U slučaju vožnje dviju osoba i prtljaga, tlak punjenja potrebno je povećati za 0,2 bara.

Općenito/uopšteno važi: bolje viši nego niži tlak punjenja!

F La pression des pneumatiques

Il est de la plus grande importance pour rouler en sécurité de conserver une pression correcte dans les pneumatiques. Il est recommandé de la vérifier régulièrement, par exemple, une fois par semaine, lorsque les pneus sont froids. Les conducteurs de moto ou de scooter entretiennent souvent leur machine avec beaucoup de soin, mais font peu attention à la pression des pneus. Si la pression est trop élevée, la surface du pneu en contact avec la route sera trop étroite, et la conduite sera moins agréable. Si la pression est trop basse, la stabilité du véhicule est diminuée, les pneus chauffent et s'usent plus rapidement, la consommation augmente, et la vitesse diminue.

Lorsque vous gonflez un pneu, suivez précisément les les instructions du fabricant (généralement, les pressions minimum sont indiquées).

Lorsque le véhicule devra transporter 2 personnes et/ou des bagages, il est conseillé d'augmenter la pression de 0.2 bar.

Il est généralement préférable de rouler avec une pression plus élevée que trop basse.

I Pressioni di gonfiaggio

La pressione nel pneumatico è una componente molto importante per il guidatore e per il pneumatico stesso. E' consigliabile controllare periodicamente la pressione dei pneumatici (es. una volta alla settimana), sempre a freddo. Gli utilizzatori di motoveicoli sono spesso intenti a lavorare sui propri mezzi, ma spesso si dimenticano delle pressioni.

La giusta pressione è molto importante per una guida sicura. Una pressione troppo alta riduce l'impronta a terra del pneumatico e rende il veicolo poco confortevole, mentre una pressione troppo bassa fa sì che il veicolo diventi difficile da guidare, il pneumatico si surriscalda con rischio di danneggiamento, gli consumi aumentano con una perdita di velocità del veicolo.

E' consigliabile durante il gonfiaggio dei pneumatici seguire i consigli del produttore del veicolo (solitamente vengono inseriti i valori più bassi). Per la guida del veicolo con due persone e consigliato un aumento delle pressioni base di 0,2 bar.

E' meglio una pressione più alta che non bassa.

GR Πίεση Ελαστικών

Είναι εξαιρετικής σημασίας για την ασφαλή οδήγηση μιας μοτοσυκλέτας η σωστή πίεση των ελαστικών. Συστήνεται να ελέγχεται συχνά, π.χ. μια φορά την εβδομάδα και όταν τα ελαστικά είναι κρύα. Οι οδηγοί μοτοσυκλετών και scooters παρόλο που ασχολούνται γενικά με την μοτοσυκλέτα τους, συνήθως παραμελούν και ξεχνούν να ελέγξουν την πίεση των ελαστικών. Εάν η πίεση είναι πολύ υψηλή, η επιφάνεια επαφής μεταξύ ελαστικού και δρόμου μικραίνει και η οδήγηση γίνεται λιγότερο άνετη. Εάν η πίεση είναι πολύ χαμηλή, η ευκινησία και η σταθερότητα του δικύκλου μειώνεται, το ελαστικό ζεσταίνεται υπερβολικά και φθείρεται, η κατανάλωση καυσίμου αυξάνεται και η τελική ταχύτητα του οχήματος μειώνεται.

Όταν φουσκώνετε τα ελαστικά του δικύκλου σας, η συνιστώμενη από τον κατασκευαστή πίεση ελαστικών πρέπει να λαμβάνεται υπόψιν (συνήθως συστήνεται η minimum πίεση). Όταν δύο άτομα επιβαίνουν ή και η μοτοσυκλέτα είναι φορτωμένη με βαλίτσες, συστήνεται να αυξάνεται η πίεση κατά 0.2 bar.

Γενικά: Είναι καλύτερο η πίεση των ελαστικών να είναι υψηλότερη, παρά χαμηλότερη.

SI Polnilni tlak

Polnilni tlak v plaščih je zanje in za vznika izrednega pomena. Priporočljivo je, da ga preverjamo redno (npr. enkrat tedensko), in to takrat, ko so gume hladne. Vozniki motorjev ali skuterjev si ponavadi radi dajejo opravka pri svojih vozilih, vendar se redkokdaj spomnijo, da bi preverili tlak v plaščih.

Pravilen tlak je zelo pomemben za varno vožnjo. Previsok tlak zmanjšuje stično površino plašča s podlago in moti udobnost vožnje. Prenizek tlak pa poslabšuje okretnost in uravnovešenost vozila, plašči se pretirano segrevajo in obrabljajo, poveča se tudi poraba goriva, zmanjša se končna hitrost vozila.

Pri polnjenju pnevmatik s pravilnim tlakom je potrebno upoštevati navodila proizvajalca vozila (ponavadi navajajo najnižje dovoljene tlake). Pri prevažanju dodatnih oseb ali prtljage je potrebno tlak polnjenja zvišati za 0,2 bara.

Na splošno velja: bolje višji tlak kakor prenizek!
